

DISINFECTING ARTICLE WITH EXTENDED EFFICACY

ABSTRACT

The present invention relates to disinfecting articles and wipes saturated with an aqueous hypochlorite composition with improved stability and extended efficacy for cleaning and disinfecting surfaces against harmful and infectious pathogens. The wipe substrate is selected from hypochlorite stable materials that do not catalyze decomposition of the associated aqueous hypochlorite releasing compositions. The disinfectant articles provide a minimum disinfecting level of active hypochlorite for an extended time, ensuring reliably disinfection of hard surfaces such as countertops, toilet seats, door knobs and the like commonly found in the home, hospital, food service and other industries.
